

Structured Feedback Session

Usefulness, Gaps & Adoption Pathways · 14:00–15:00

2026-06-22

On-the-record input from FCDO, IOM, NGOs, and partner organisations, to be synthesised and circulated within one week. Each University of Liverpool team member is responsible for live capture in their group.

Before we begin: we would like to audio-record this session to support note-taking. The recording will be sent to the project team, stored securely, and deleted from all personal devices once transferred. Please indicate now if you would prefer not to be recorded.

Opening

~5 min

Facilitator: “This session is on the record — your input will directly shape how this pipeline is refined and how it’s presented to decision-makers and funders. We need to know where it works, where it doesn’t, and what it would actually take for your organisation to use it.”

“We’ll give each group a specific turn so everyone speaks, not just the loudest voice in the room. We’ll capture responses live under three headings: **useful, missing, conditions for adoption.**”

Brief framing on the pipeline — one minute only. Restate the three value propositions as a single orienting sentence:

Timely post-disaster insights from digital trace data, used to triangulate traditional sources and enable anticipatory action in recurrent flood contexts.

Confirm that everyone has seen at least one SitRep before inviting feedback. If not, direct them to the resources page.

Liverpool team recorder: Note who is present from each stakeholder group. If someone has not seen a SitRep, flag this — their feedback on format and interpretability will be especially valuable.

Block 1 · Usefulness

~15 min

Where would this have changed a decision?

“Think back to the last 12 months. Name a specific decision point — a coordination call, a funding request, a response plan — where having earlier or more granular displacement data would have changed what you did or recommended.”

Go in this order, one group at a time:

FCDO IOM / DTM NGOs Partners

- **If they say “useful in general”** — press for the specific decision, not the general problem.
- **If they say “we already had the data”** — note the source; that’s a triangulation or validation case.
- **If they say “we wouldn’t have had access”** — note as an adoption barrier; hold for Block 3.

Liverpool team recorder: Capture the specific decision, the organisation, and the time-frame. Paraphrase is not enough — write what they actually say. Use the capture sheet on the last page.

Block 2 · Gaps

~20 min

What’s missing that would make this unusable as-is?

“Set aside whether it’s a good idea in principle. If someone handed you a SitRep tomorrow and asked you to use it in a briefing or operational decision — what would stop you? What would you need to verify first?”

If the room goes quiet, prompt by dimension:

- **Timeliness** — how quickly after an event would you need it? (*Stakeholders have indicated up to one month post-event may be acceptable.*)
- **Granularity** — is admin2 / district-level sufficient, or do you need finer resolution? (*Current guidance: keep to standard admin levels.*)
- **Trust and provenance** — what would you need to know about the data source to cite this in a report?
- **Data protection** — what questions would your legal or ethics team ask before you used it?
- **Format** — would a PDF SitRep reach the right people, or does it need to be a live dashboard, a data feed, a one-page summary?
- **Bias and coverage** — who is likely missing from the digital trace signal, and does that matter for your context?

Watch for these specific gaps to surface:

- **Representativeness** — rural, low-connectivity, elderly, or already-displaced populations
- **Interpretability** — what does a “5-day displacement threshold” mean to a non-technical audience?
- **Comparison baseline** — displacement relative to what — pre-event norms, neighbouring areas?
- **Absence of outcome data** — does the signal tell you where people went, or only that they left?

Liverpool team recorder: Tag each gap to a dimension (timeliness / trust / format / bias...). Note whether the gap is *fixable within the current pipeline* or *a structural limitation of the data*. This distinction matters for the synthesis.

Block 3 · Adoption Pathways

~15 min

What would need to be true to integrate this?

“If you wanted to put this into a real workflow — even a small pilot — what would your organisation need first? What’s the first thing that would block it?”

Probe by barrier type:

- **Capacity** — does your team have someone who could interpret a GPS mobility analysis, or would you need it translated into plain language?

- **Institutional trust** — would it need to be validated by an existing partner (UN, ICRC) before your organisation would cite it?
- **Trigger mechanism** — for anticipatory use, who would initiate the request for a SitRep, and on what timeline?

Note for facilitator: Data-sharing agreements and legal buy-in from mobile network operators are known constraints but are *beyond the scope of this session*. Acknowledge if raised; do not open a full discussion.

Planned outputs already in development to address accessibility: **Digital Trace Fact Sheets** explaining data types to policy and humanitarian audiences, and a streamlined SitRep format designed to be readable in under five minutes.

Liverpool team recorder: Note the barrier type and whether it is *organisational* (capacity, trust) or *structural* (procurement, legal). Flag any barriers shared across multiple stakeholder groups — those are priorities.

Close

~5 min

“We’ll circulate a one-page summary of this session within one week — grouped under the three headings — so you can check what we’ve captured. If we’ve misrepresented anything, we want to know. This input will feed directly into the hackathon briefs and the project’s next phase.”

Live Capture Sheet

One row per substantive contribution. Record in the speaker’s words where possible. Tag each input: **U** = Usefulness · **G** = Gaps · **A** = Adoption

Organisation	Input	Block
--------------	-------	-------

Organisation	Input	Block
--------------	-------	-------

After the session — recorder checklist:

- Tag every input to a block (U / G / A) and note the organisation
- Distinguish fixable gaps from structural data limitations
- Note any inputs raised but not captured in the room
- Share raw notes with Elisabetta before end of day
